# Who is Damien?

Damien Burks

- Started coding at 16 and have been building ever since
- Senior Security Engineer at FICO by day,
  founder of The DevSec Blueprint by night
- Former SVP, Cloud Security Engineering at Citi,
  and Security Software Engineer at Verizon
- AWS Community Builder, Security & Identity
- LinkedIn Learning Instructor and regular conference speaker
- I create courses and hands-on technical walkthroughs
- I offer resume reviews, LinkedIn reviews, and interview coaching
- Anime, cars, and video games when I need to rest

# Who is Ashley Jeter?

All Things STEM with Ashley

B.S. in Metallurgical Engineering and Material Science, The University of Alabama

M. Eng. in Engineering Management, Vanderbilt University

Founder of All Things STEM With Ashley

18 Under 31 Award Recipient

From Alpharetta, Ga

Interned at NASA and Deloitte,

Currently in the Aerospace Industry

Performed in Macy's Thanksgiving Day Parade

# A client’s first DSB Lite launch

DSB Lite introduces visitors to The DevSec Blueprint and its purpose.

## CLIENT REQUEST

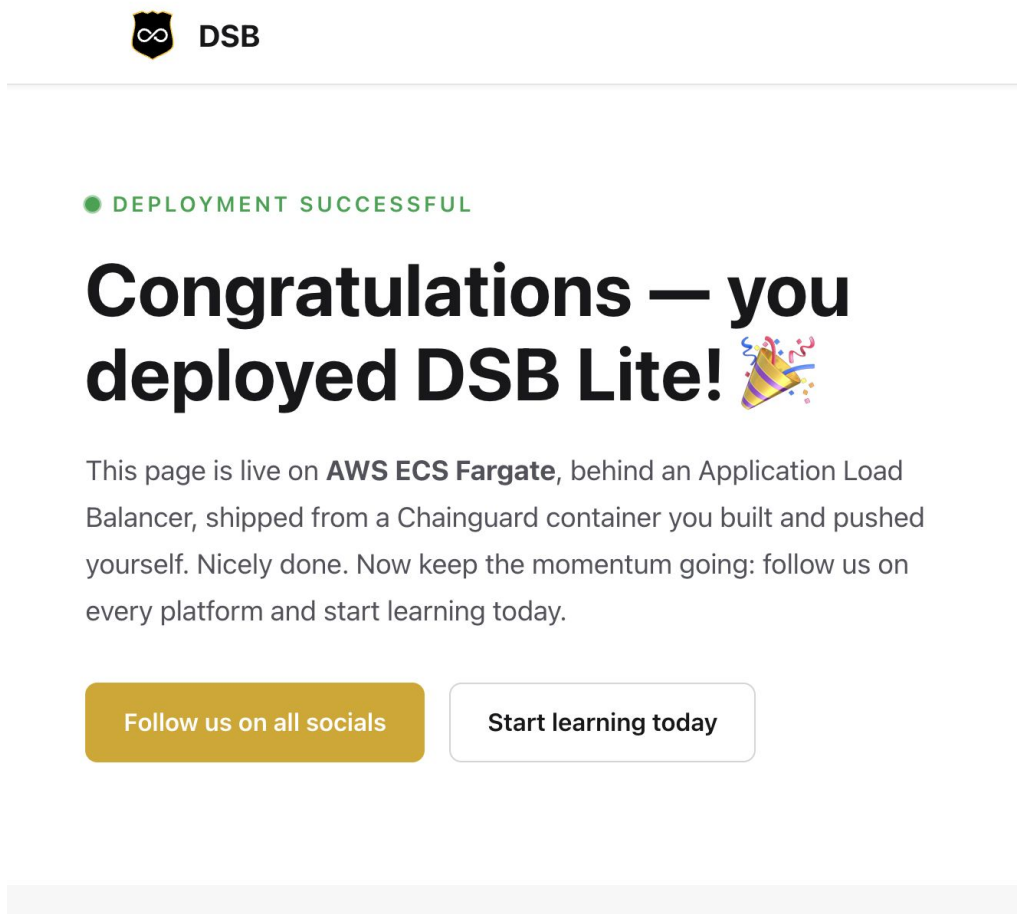

A company wants to introduce its employees to The DevSec Blueprint through DSB Lite, a small web application that explains what DSB is, who it serves, and why it exists.

## CURRENT STATE

The source code is ready in GitHub and the app works locally. The client has an AWS account, but no deployment pipeline, container registry, runtime, or public endpoint.

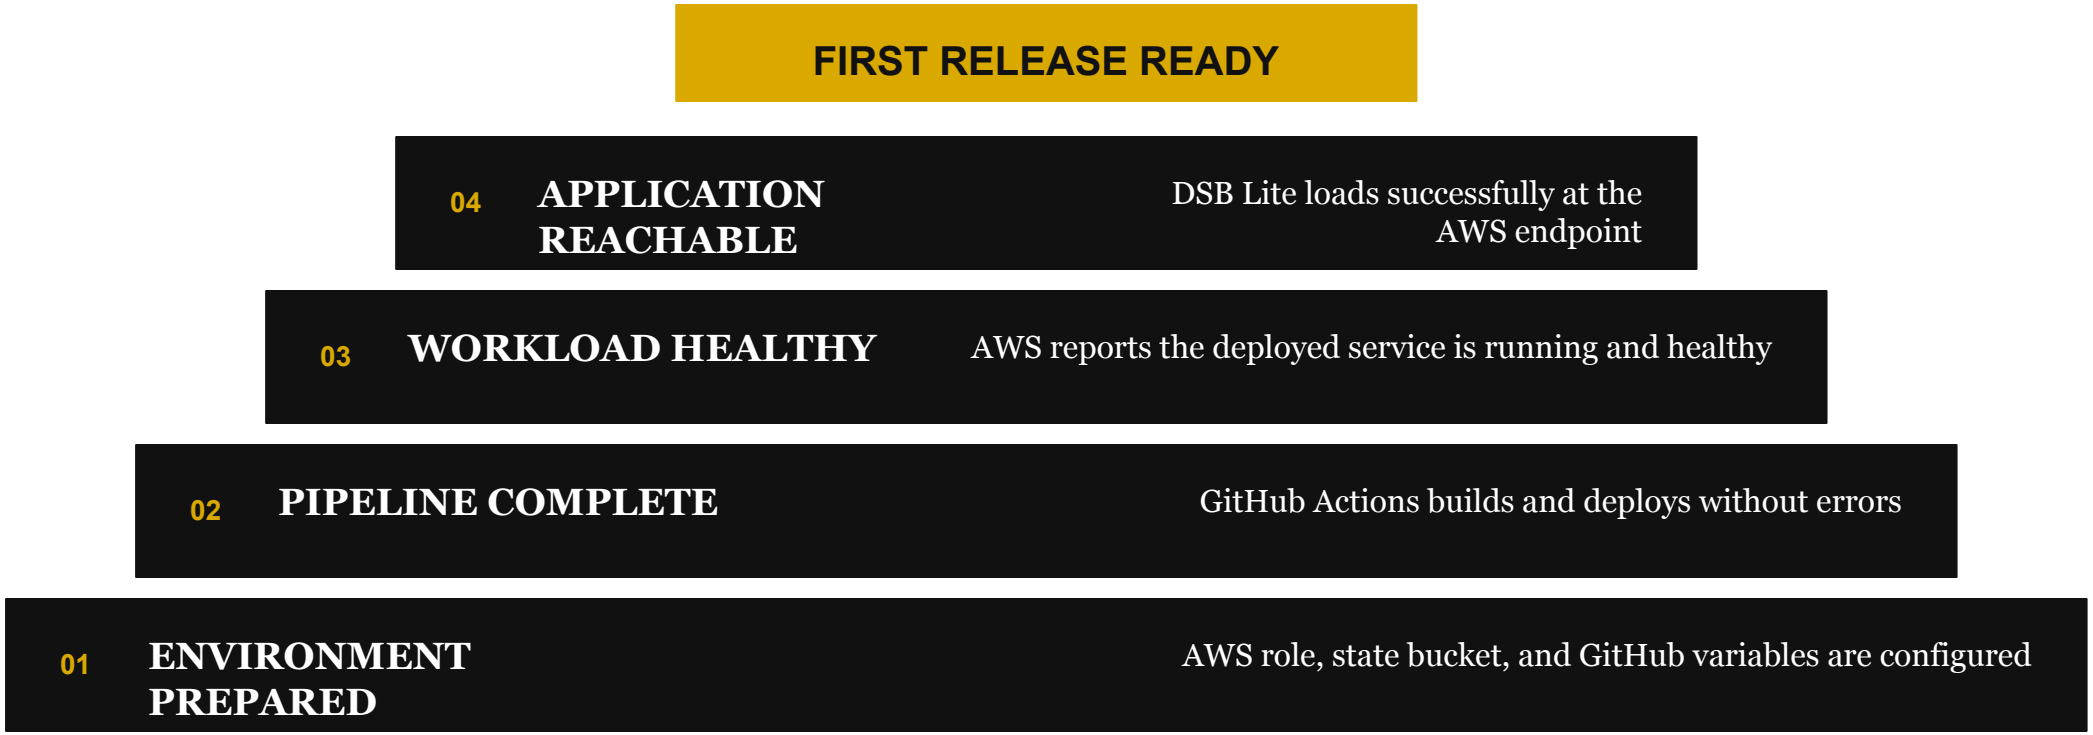

## OUR ASSIGNMENT

Create a repeatable path that packages DSB Lite as a container, deploys it in the client’s AWS account, and returns a working endpoint. DNS and the broader production setup come later.

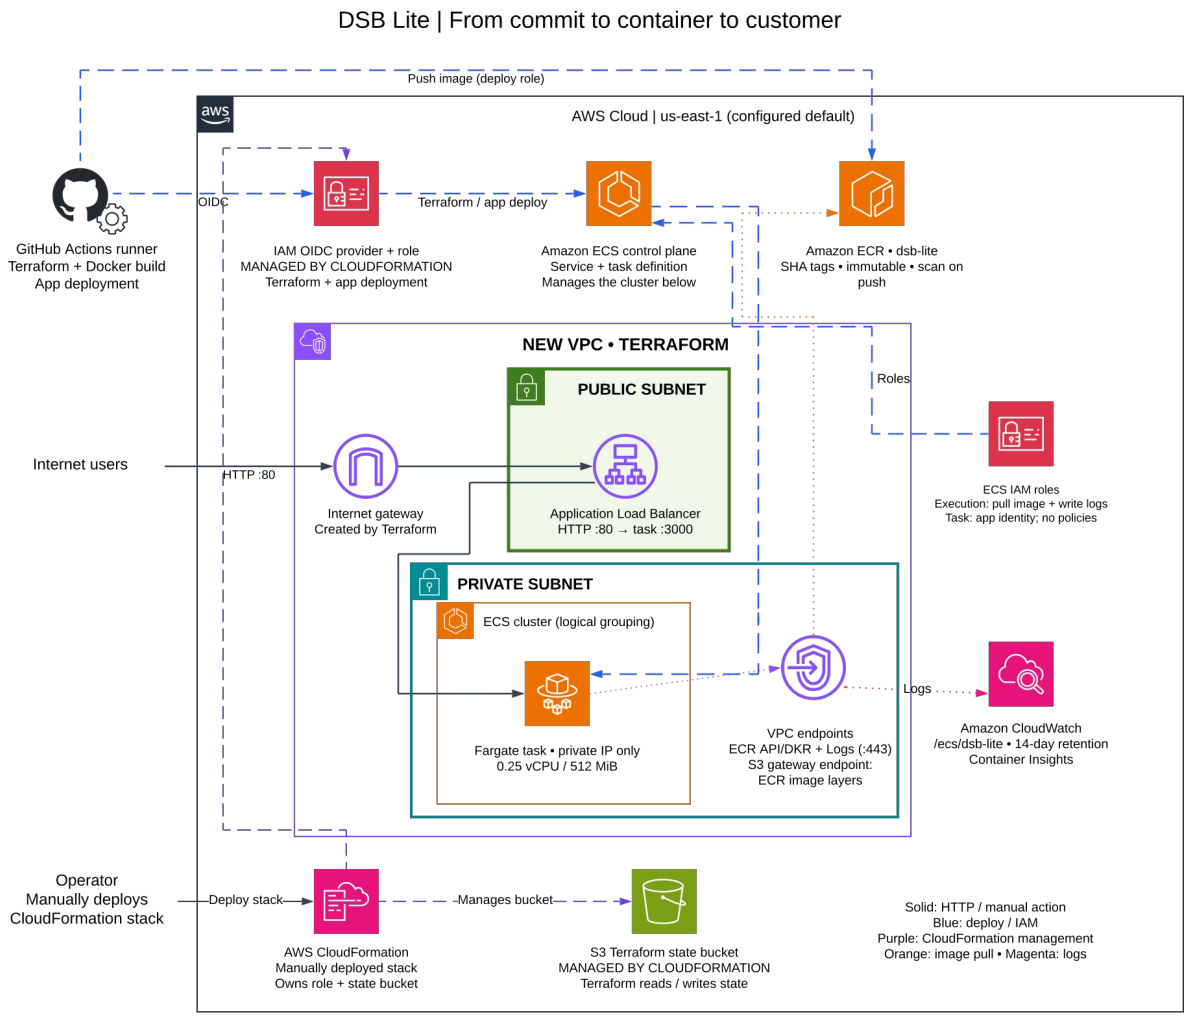

# What success looks like

Each layer supports the client's first release.

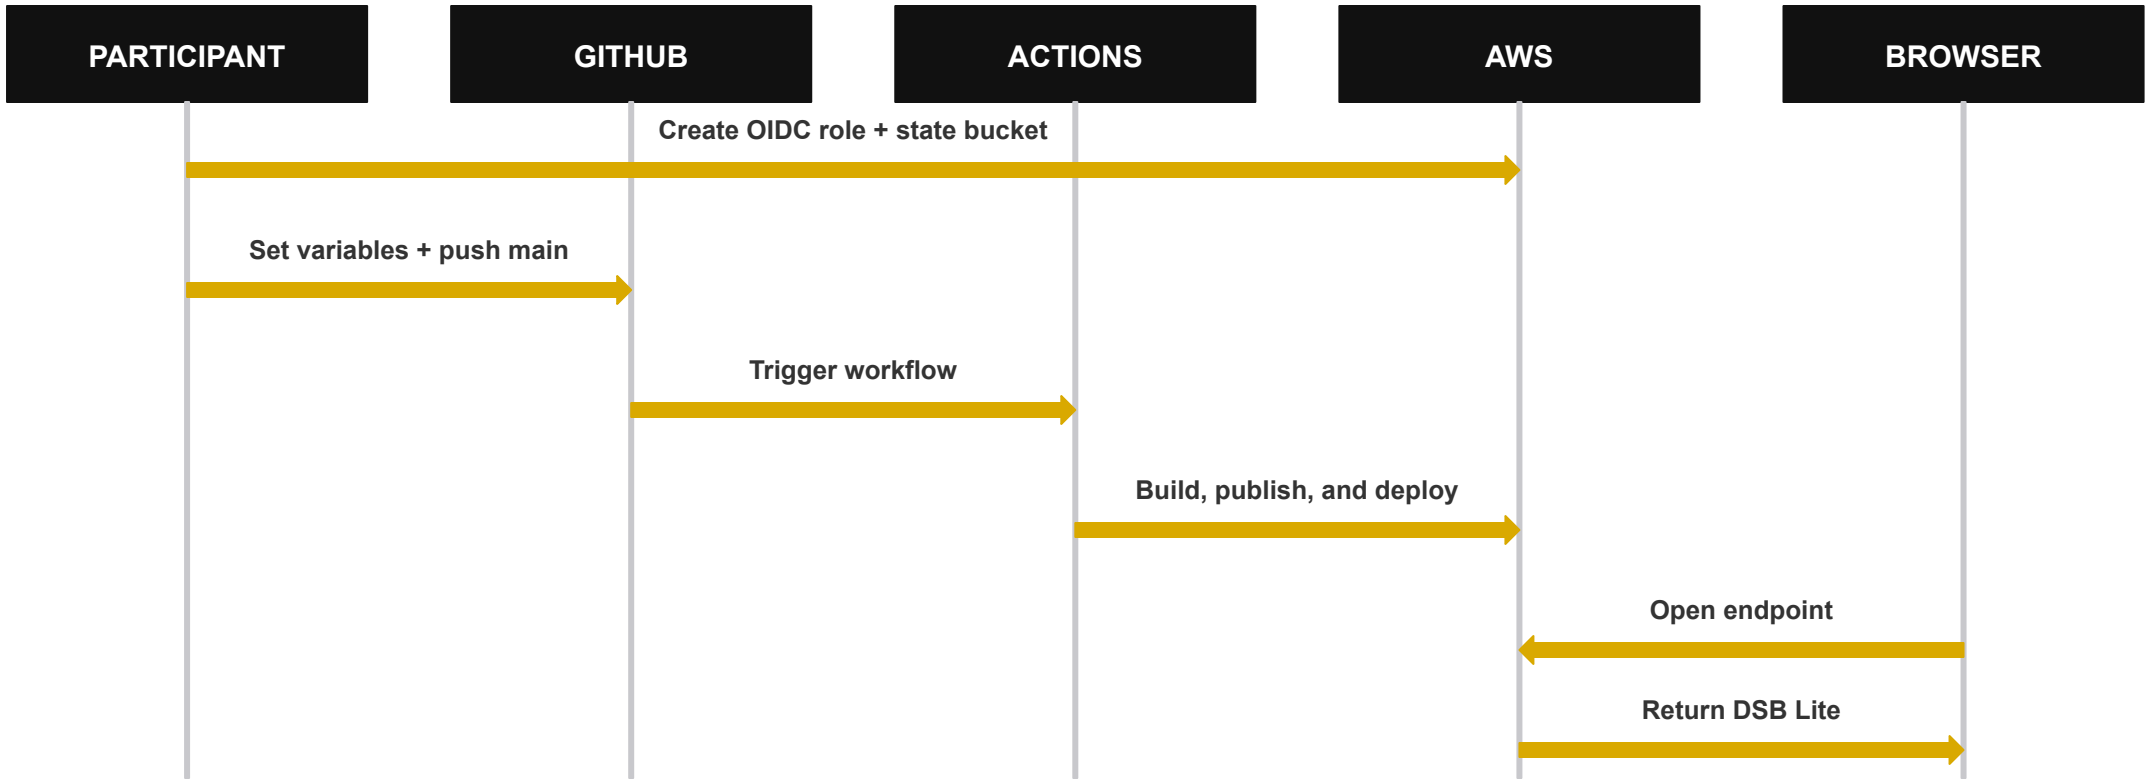

# The deployment architecture

CloudFormation owns the OIDC role and Terraform state bucket; an operator deploys the stack manually.
GitHub Actions assumes the OIDC role. Terraform uses the S3 backend and manages the network + application resources.
Private tasks use VPC endpoints. Cluster boundary is logical; task ENIs are private. Additional ALB AZ omitted.

# The journey from commit to cloud

We will follow this path together in the live build.

# Let’s build

Fork the repository and open the setup guide.

START HERE

01 **Fork the repository**

02 **Open the setup guide**

03 **Keep GitHub + AWS open**

Follow the README as we build together.
